

1 DMA Controller

DMA controller (DMAC) is dedicated to transfer data between on-chip peripherals (MSC, AIC, UART, etc.), external memories, and memory-mapped external devices.

1.1 Features

- Support up to 6 independent DMA channels
- Descriptor or No-Descriptor Transfer
- Transfer data units: byte, 2-byte (half word), 4-byte (word), 16-byte or 32-byte
- Transfer number of data unit: $1 \sim 2^{24}$
- Independent source and target port width: 8-bit, 16-bit, 32-bit
- Two channel priority modes: fixed, round robin.

1.2 Register Descriptions

Table 1-1 DMAC Registers

Name	Description	RW	Reset Value	Address	Access Size (bit)
DSA0	DMA Source Address 0	RW	0x0	0x13020000	32
DTA0	DMA Target Address 0	RW	0x0	0x13020004	32

Table 1-2 Transfer Request Types

RT4-0	Description
0~7	Reserved
8	Auto-request (ignore RDIL3-0, external address → external address)
9~19	Reserved
20	UART transmit-fifo-empty transfer request (external address → UTHR)
21	UART receive-fifo-full transfer request (URBR → external address)
22	SSI transmit-fifo-empty transfer request
23	SSI receive-fifo-full transfer request
24	AIC transmit-fifo-empty transfer request
25	AIC receive-fifo-full transfer request
26	MSC transmit-fifo-empty transfer request
27	MSC receive-fifo-full transfer request
28	TCU channel n (overflow interrupt, external address→external address space)
29	SADC transfer request (SADC → external address)
30	SLCD transfer request (external address → SLCD)
31	Reserved

NOTES:

- Only auto request can be concurrently selected in all channels with different source and target address.

-
2. For on-chip device DMA request except TCU, the corresponding source or target address that map to on-chip device must be set as fixed.

1.2.5 DMA Channel Control/Status (DCSn, n = 0 ~ 5)

DCS0, DCS1, DCS2, 0x13020010, 0x13020030, 0x13020050,

5:0	CIRQn	CIRQn (n=0~5) denotes pending status for corresponding channel 0, no abnormal situation or normal DMA transfer is in progress 1, abnormal situation occurred or normal DMA transfer done	RW

1.3 DMA manipulation

1.3.1 Descriptor Transfer

To do proper Descriptor DMA transfer, do as following steps:

1. First of all, check whether the status of DMA controller are available, that is, for global control (DMAC), ensure that DMAC.AR=0 and DMAC.HLT=0; while for expected channels, ensure that DCSn.AR=0, DCSn.HLT=0, DCSn.TT=0, DTCn=0 and DCSn.INV=0.
2. Set DMAC.DMAE=1 and expected DCSn.CTE=1 to launch DAM transfer
3. For Descriptor transfer, guarantee DCSn.NDES=0
4. Build descriptor in memory. Write the first descriptor address in DDAn and the address must be 16Bytes aligned. The descriptor address includes two parts: Base and Offset address. If the descriptor is linked, the 32-bit address of next descriptor is composed of 20-bit Base address in DDAn and 8-bit Offset address in DES3.DOA and the four LSB is 0x0. See Table 1-4 for the detailed 4-word descriptor structure.
5. Set 1 to the corresponding bit in DDR to initiate descriptor fetch
6. Hardware clears the corresponding bit in DDR as soon as it starts to fetch the descriptor.
7. If DES0.V =0 and DES0.VM=1, DMAC stops and set DCSn.INV=1. Otherwise, it waits for dma request from peripherals to start dma transfer
8. After DMAC completes the current descriptor dma transfer, if DES0.VM=1, it clears DES0.V to 0 and writes back to memory. If DES0.Link=1, it sets DCSn.CT to 1, otherwise it sets DCSn.TT to 1. If the interrupt enabled, it will generates the corresponding interrupts.
9. If DES0.LINK=1, after DMAC completes the current descriptor dma transfer and return to fetch the next descriptor and continues dma transfer until completes the descriptor dma transfer which DES0.LINK=0.

Table 1-4 Descriptor Structure

Word	Bit	Name	Function
1st (DES0)	31	EACKS	External DMA DACKn output polarity select
	30	EACKM	External DMA DACKn output Mode select
	29-28	ERDM	External DMA request detection Mode
	27	EOPM	External DMA End of process mode
	26-24	Reserved	
	23	SAI	Source Address Increment
	22	DAI	Target Address Increment
	21-20	Reserved	
	19-16	RDIL	Request Detection Interval Length
	15-14	SP	Source port width
	13-12	DP	Target port width
	11	Reserved	
	10-8	TSZ	Transfer Data Size
	7	TM	Transfer Mode
	6-5	Reserved

	3	VM	Descriptor Valid Mode
	2	VIE	Descriptor Invalid Interrupt Enable
	1	TIE	Transfer Interrupt Enable
	0	LINK	Descriptor Link Enable
2st (DES1)	31-0	DSA	Source Address
3st (DES2)	31-0	DTA	Target Address
4st (DES3)	31-24	DOA	Descriptor Offset address
	23-0	DTC	Transfer Counter

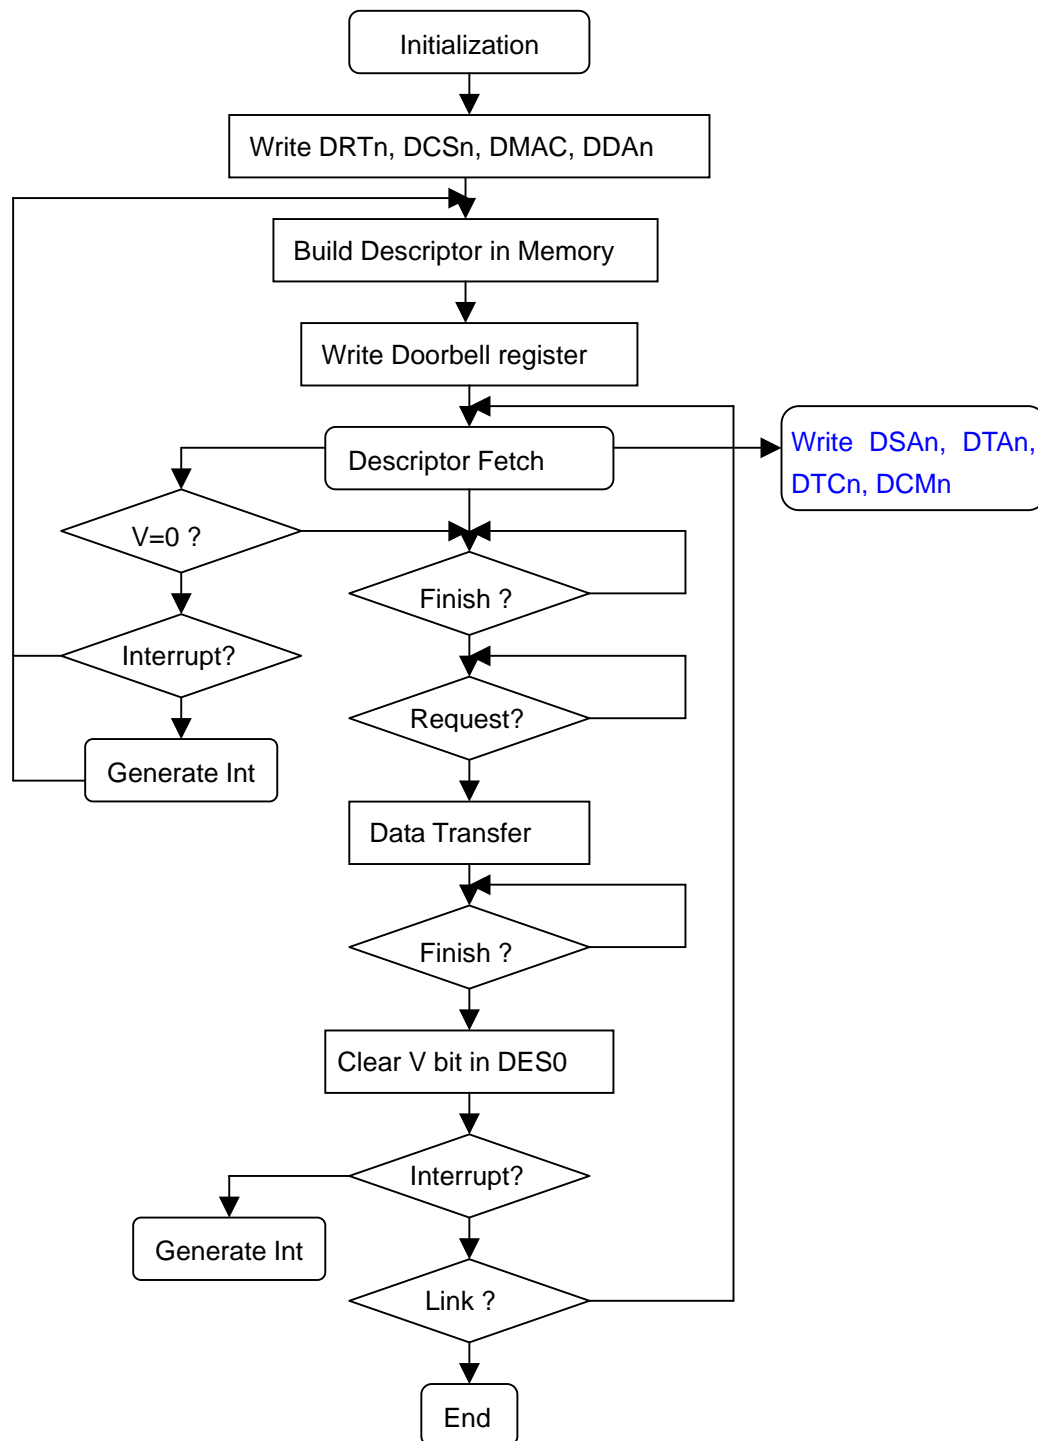

Figure 1-1 Descriptor Transfer Flow

1.3.2 No-Descriptor Transfer

To do proper DMA transfer, do as following steps:

1. First of all, check whether the status of DMA controller are available, that is, for global control (DMAC), ensure that DMAC.AR=0 and DMAC.HLT=0; while for expected channels, ensure that DCSn.AR=0, DCSn.HLT=0 and DCSn.TT=0 and DTCn=0.
2. For each channel n, initialize DSAn, DTAn, DTCn, DRTn, DCSn, DCMn properly
3. Set DMAC.DMAE=1 and expected DCSn.CTE=1 and DCSn.NDES=1 to launch DAM transfer

For a channel with auto-request (DRTn.RT=0x8), the transfer begins automatically when the DCSn.CTE bit and DMAC.DMAE bit are set to 1. While for a channel with other request types, the transfer does not start until a transfer request is issued and detected.

For any channel n, The DTCn value is decremented by 1 for each successful transaction of a data unit. When the specified number of transfer data unit has been completed (DTCn = 0), the transfer ends normally. Meanwhile corresponding bit of DIRQP is set to 1. If DCMn.TIE bit is set to 1, an interrupt request is sent to the CPU. However, during the transfer, if a DMA address error occurs, the transfer is suspended, both DCSn.AR and DMAC.AR are set to 1 as well as corresponding bit of DIRQP. Then an interrupt request is sent to the CPU despite of DCMn.TIE.

Sometimes, for example, an UART parity error occurs for a channel that is transferring data between such UART and another terminal. In the case, both DCSn.HLT and DMAC.HLT are set to 1 and the transfer is suspended. Software should identify halt status by checking such two bits and re-configure DMA to let DMA rerun properly later.

1.4 DMA Requests

DMA transfer requests are normally generated from either the data transfer source or target, but also they can be issued by on-chip peripherals that are neither the source nor the target. There are two DMA transfer request types: auto-request, and on-chip peripheral request. For any channel n, its transfer request type is determined through DRTn.

1.4.1 Auto Request

When there is no explicit transfer request signal available, for example, memory-to-memory transfer or memory to some on-chip peripherals like GPIO, the auto-request mode allows the DMA to automatically generate a transfer request signal internally. Therefore, when DMA initialization done, once the DMAC.DMAE and DCSn.CTE are set to 1, the transfer begins immediately in channel n which DRTn=0x8.

1.4.2 On-Chip Peripheral Request

In the mode, transfer request signals come from on-chip peripherals. All request types except 0x8 (value of DRT) belong to the mode. Both single and block transfer mode are available. Note that in single mode, the transfer byte number for one request detection according to DCMn.RDIL must be equal or less than the byte number according to receive or transmit trigger value of source or target devices.

1.5 DMA Transfer Modes

Each channel can toggle between two transfer modes: single and block

1.5.1 Single Mode

A channel with single mode will periodically detect the request signal according to presetting detection interval length (DCMn.RDIL). Moreover, during the transfer, after a transaction of a data unit (8-bit, 16-bit, 32-bit, 16-byte, or 32-byte), an internal arbitrator in the DMA will arbitrate all active channels again to select one to represent DMA's bus request to participate the AHB bus arbitration. Above process will repeat when the channel captures the bus again until corresponding DCSn.TT bit equals to 1 or abnormal situation (address error, halt) occurs.

1.5.2 Block Mode

Once a channel with block mode captures the bus, it will do data transfer continuously until all data units are transferred or abnormal situation occurs. During the process, it does not release the bus so that neither other channels nor other bus masters can take up the bus. In the mode, the channel just detects the request signal once and corresponding DCMn.RDIL is ignored.

1.6 Channel Priorities

There are two priority modes: fixed, round robin

1.6.1 Fixed Mode

The relative channel priorities are unvaried in the mode.

- CH0 > CH1 > CH2 > CH3 > CH4 > CH5 > CH6 > CH7
- CH0 > CH2 > CH3 > CH1 > CH4 > CH6 > CH7 > CH5
- CH2 > CH0 > CH1 > CH3 > CH6 > CH4 > CH5 > CH7

1.6.2 Round Robin Mode

In the mode, there are two priority groups: CH0~CH3 and CH4~CH7. Round robin is performed in each group, and CH0~CH3 always has higher priority than CH4~CH7.

Table 1-5 Relationship among DMA Transfer connection, Request Mode and Transfer Mode

Transfer Connection	Request Mode	Transfer Mode	Data Size (bits)	Channel
External memory or memory-mapped external device and on-chip peripheral module	Auto on-chip	Block/Single	8/16/32 16-byte/32-byte	0~5

1.7 Examples

1.7.1 Memory-to-memory auto request No-Descriptor Transfer

Suppose you want to do memory move between two different memory regions through channel 3, for example, moving 1KB data from address 0x20001000 to 0x20011000, do as following steps:

- Check if (DMAC.AR==0 && DMAC.HLT==0 && DCS3.AR==0 && DCS3.HLT==0 && DCS3.CT==0 && DCS3.NDES=1 && DTC3==0)
- If above condition is true, set value 0 to DCS3.CTE to disable the channel 3 temporarily
- Set source address 0x20001000 to DSA3 and target address 0x20011000 to DTA3
- Suppose the data unit is word, set transfer count number 256 (1024/4) to DTC3
- Set auto-request (0x8) to DRT3
- Up to now, only the most important channel control register DCM3 is left, set it carefully:
 - Set value 1 to SAI and DAI^{*1}
 - Ignore RDIL because in the case there is no explicit request signal can be detected
 - Set word size (0) to SP and DP^{*2}
 - Set single mode (0) to TM^{*3}
 - Set value 1 to TIE to let CPU do some post process after the transfer done
- Set value 1 to DCS3.CTE and DMAC.DMAE to launch the transfer in channels 3
- When the transfer terminates normally (DTC3==0 && DCS3.TT==1), DIRQP.CIRQ3 will automatically be set value 1 and an interrupt request will be sent to CPU
- When CPU grants the interrupt request, in the corresponding IRQ handler, software must clear the DCS3.CT to value 0, and the behavior will automatically clear DIRQP.CIRQ3.

NOTES:

- Either source or target is a FIFO, must not enable corresponding address increment
- When either source or target need be accessed through EMC (external memory controller), the real port with of the device is encapsulated by EMC, so you can set any favorite port with for it despite of the real one
- Block mode may block bus for a long time, do not use the mode unless the data are emergency
